March 10, 2005. I would like to thank you for discussing possible amendments to the claims with me back in June. As you will see, Applicants' have made several amendments to the claims as we've discussed.

Thank you.

DETAILED ACTION

Applicant's arguments with respect to claims have been considered but are moot in view of the new ground(s) of rejection.

Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

Claims 9-15,17-26 are rejected under 35 U.S.C. 103(a) as being unpatentable over Stenzler on record. Stenzler teaches a method of promoting healing of a wound comprising topically applying to the damaged tissue (wound) which is surrounded by an air impermeable cover (bathing unit) an effective amount of gaseous nitric oxide (wound healing agent), oxygen (wound healing agent) and nitrogen (inert agent that enhances local amount nitric oxide delivered to wound). The nitric oxide is applied from a pressurized cylinder which suggests a spray application method. Stenzler teaches that nitrogen prevents the nitric oxide from converting to NO2. See abstract, column 4 lines 1-47. The method promotes the healing of infections incurred by bacteria (pathological process). See column 3 lines 17-25. Stenzler employs a nitric oxide concentration ranging from about 100 to around 1200 ppm in the method. See column 3 line 46 column 4 line 24. Stenzler teaches the exposure of wound to nitric oxide for an average of 8 hours. See column 2 lines 7-22, Stenzler does not teach a method employing 20-1000 ppm gaseous nitric acid. Stenzler's method does disclose a step wherein the

Application/Control Number: 10/615,546

Art Unit: 1616

Page 3

wound is pretreated or posttreated with nitric oxide plus an agent. In essence both Applicant and Stenzler teaches a step involving topically applying gaseous nitric oxide plus an agent to a wound. Stenzler teaches that the application of gaseous nitric oxide plus agent is prior to or after exposing the wound to nitric oxide. However, in the absence of unexpected results, it is obvious that both inventions would yield similar results since both prior art and instant inventions teach the step of applying gaseous nitric oxide plus an agent to the wound. It would have been obvious to one having ordinary skill in the art to employ the instant ppm amount of gaseous nitric acid since the prior art and instant invention ppm amounts of gaseous nitric overlap.

Claims 9-15,17-26 are rejected under 35 U.S.C. 103(a) as being unpatentable over Hole on record. Hole teaches a method of promoting healing of a wound comprising topically applying to the damaged tissue (wound) which is surrounded by an air impermeable cover (envelope) an effective amount of gaseous nitric oxide (wound healing agent), oxygen (wound healing agent) and nitrogen (inert agent that enhances local amount nitric oxide delivered to wound). The nitric oxide is applied from a pressurized cylinder which suggests a spray application method. Hole teaches that nitrogen prevents the nitric oxide from converting to NO2. See abstract, paragraph 36. The method promotes the healing of infections incurred by bacteria (pathological process). See paragraph 9. Hole employs a nitric oxide concentration ranging from about 100 to around 1000 ppm in the method. See paragraphs 42-43. Hole teaches the exposure of wound to nitric oxide for an average of 8 hours. See paragraph 10. Hole does not teach a method employing 20-1000 ppm gaseous nitric acid. Hole's method

Page 4

Art Unit: 1616

Application/Control Number: 10/615,546

does disclose a step wherein the wound is pretreated or posttreated with nitric oxide plus a wound healing agent. In essence both Applicant and Hole teaches a step involving topically applying gaseous nitric oxide plus an agent to a wound. Hole teaches that the application of gaseous nitric oxide plus agent is prior to or after exposing the wound to gaseous nitric oxide. However, in the absence of unexpected results, it is obvious that both inventions would yield similar results since both prior art and instant inventions teach the step of applying gaseous nitric oxide plus an agent to the wound. It would have been obvious to one having ordinary skill in the art to employ the instant ppm amount of gaseous nitric acid since the prior art and instant invention ppm amounts of gaseous nitric overlap.

Telephonic Inquiry

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Alton N. Pryor whose telephone number is 571-272-0621. The examiner can normally be reached on 8:00 a.m. - 4:30 p.m..

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Gary Kunz can be reached on 571-272-0887. The fax phone number for the organization where this application or proceeding is assigned is 703-872-9306.
